

The Norwegian Centre for E-health Research produces and disseminates research and knowledge about e-health. The centre is committed to support the Norwegian authorities to develop a knowledge-based e-health policy. The overall objectives of the national e-health strategy are:

- Healthcare professionals should have easy and safe access to patient and user information
- Citizens should have access to simple and secure digital services
- Data shall be available for quality improvement, health monitoring, management and research

Through the portfolio of research projects funded by competitive grants, the Norwegian Centre for E-health Research ensures strong and competitive competences within the fields relevant for the national and international development in e-health. The goal is to serve with knowledge on the following areas:

- Future health record: Effects of national services
- Integrated patient pathways: Patient pathways and models for integrated care
- Personal systems and connected care
- Health data availability and analysis
